

Environmental Management Bureau – CALABARZON Region conducted simultaneous air quality sampling amidst Enhanced Community Quarantine (ECQ) from the stations in Antipolo and Biñan. Community Lockdown started in March 17, 2020. PM10 and PM2.5 concentration levels for both cities decreased as the ECQ started until the 1st week of April. This is because of the sudden reduction of industrial activities and drop in road transport. However, it is noticeable that there was increase in level of PM10/2.5 for both cities on the 2nd week of April since some establishment started to operate again. All concentration above for both parameters passed the National Ambient Air Quality Guidelines Value (NAAQGV).
